In the recent past, it was difficult to create, edit, share and store documents as softcopies due to lack of efficient software to do so. Over the years, companies like Adobe in an attempt to solve the problem came up with ways to do so by introducing a software to enable creating, editing and storage of documents among other functions. Even with the development of the software, the adobe software which is the most efficient is very expensive for most people to afford since it requires a monthly subscription of sh. 3,500 which is a lot of money for people in third world countries like Kenya where most people struggle to access basic needs.

With the world going digital including learning institutions and business organizations, some businesses and most students are not able to access the services offered by Adobe because of their expensive nature. Therefore, there is need to create a software that will be affordable for everyone and work as efficiently as Adobe. The software to be created requires a yearly subscription of sh. 2,000 which is quite cheap as compared to Adobe. The software will also enable users to create, edit and store documents easily among other secondary services. This will enable many users to not only save money and time but also efficiently do their work.
